Empathy Map - Branch End-User (EEE User)

Phase 1 · Brainstorming & Ideation

Deepak P (Team Lead) · Hemanthan B N · Ganesh A K · Irfan Rifayil Z

This document is an empathy map for the primary end-user of the branch-based access control: EEE User, a branch user on the dev443713 instance who holds roles bb1-bb4 and works with the Institution Details records. It captures what this user says, thinks, does, and feels about accessing branch data, to keep the script-controlled ACL solution grounded in a real user need.

Empathy Map - EEE User

Quadrant	What the EEE branch user experiences
Says	"I only work with EEE branch records." "Why can I see other branches' student data?" "I should be able to add and update my own branch's students, and nothing else."
Thinks	Worries about accidentally editing an ECE or CSE record. Assumes the system should already keep branches separate. Wants a clean, relevant list rather than every branch at once.
Does	Logs in and opens the Institution Details list, expecting to see only EEE001 and EEE002. Uses New to add EEE students and Update / Delete on the form. Raises a concern when records from other branches appear.
Feels	Confident and in control when the list shows only the 2 EEE records. Frustrated and over-exposed when unrelated branches' data is visible. Reassured that a user without the branch roles is stopped by "Security constraints prevent access to requested page."

What this tells the team

- The user's core need is trust: the list must show only their branch, enforced by the platform, not by their own care.
- This directly validates the READ ACL (role bb1 + condition Branch is EEE + gs.hasRole script) as the feature that resolves the user's frustration.
- The verification result - EEE User sees 2 of 2 EEE records with New/Update/Delete, while a user with no branch roles is fully blocked - matches the "Feels" quadrant and confirms the design meets the user's emotional and functional needs.
