Customer Journey Map - Branch User Record Access

Phase 2 · Requirement Analysis

Deepak P (Team Lead) · Hemanthan B N · Ganesh A K · Irfan Rifayil Z

This document maps the end-to-end journey of a branch user (the EEE User, holding roles bb1-bb4) accessing the Institution Details records in the ServiceNow instance dev443713.service-now.com. It captures each stage, the action taken, the platform touchpoint involved, and the user's experience under the field-value-driven Access Control rules built on the u_institution_details table.

Journey Stages

Stage	User Action	Touchpoint	Experience / Emotion
1. Login	EEE User signs in with instance credentials	ServiceNow login page (dev443713.service-now.com)	Routine and confident - expects normal, uneventful access
2. Navigate	Opens the Institution Details module from the Application Navigator	Left navigation / module link to u_institution_details	Oriented and in control - finds the data quickly
3. View list	Reads the record list	Institution Details list view	Reassured - sees only EEE001 and EEE002 (2 of 2), the records that belong to the branch
4. Confirm scope	Notices the ECE and CSE records are absent	List row count and filter behaviour	Trust - branch privacy is respected, no clutter, no other branch's data
5. Create record	Clicks New to add a student record	New button and record form	Empowered - the bb2 role permits creation, the form opens cleanly
6. Update record	Opens EEE001, edits a field, clicks Update	Editable form with Update button	Smooth - the bb3 role permits edits and the change saves
7. Delete record	Uses Delete on a record within scope	Delete button on the record form	Confident - the bb4 role permits deletion within the branch
8. Out-of-scope boundary	Records outside EEE never surface; a colleague without bb roles (e.g. Abel Tuter) opens the table	"Security constraints prevent access to requested page" banner	Blocked but informed - a clear, deny-by-default boundary with no data leakage

Overall emotional arc: the branch user moves from routine login to reassurance (seeing only their own branch), then to empowerment (create, update, delete within scope), and finally to trust in the boundary that quietly withholds every out-of-branch record. The administrator persona, by contrast, sees all four records, and a user with no bb roles is stopped at the security-constraints page.
